Implement Client Script & UI Policy (incident)

Brainstorming & Ideation Phase :

Introduction

The Brainstorming and Ideation Phase is the initial stage of the project. In this phase, different ideas are discussed to identify how the Incident Management process can be improved using ServiceNow.

Problem Identification

In the Incident form, users may face problems such as entering incorrect information, unnecessary fields being displayed, or important fields not being made mandatory. These problems can affect the accuracy and efficiency of incident management.

Idea Generation

To overcome these problems, the use of Client Script and UI Policy is identified as a suitable solution. UI Policy can be used to make fields mandatory, visible, or read-only based on specific conditions. Client Script can be used to perform client-side validation and dynamic actions.

The main objective is to make the Incident form more user-friendly, reduce user errors, and improve the accuracy of incident-related information.

Client Script Idea

Client Scripts are used to perform actions on the Incident form based on user interactions. They can validate information, display messages, and change field values dynamically.

UI Policy Idea

UI Policies are used to control the behaviour of fields without requiring complex scripting. They can make fields mandatory, read-only, or visible based on specified conditions.

Expected Outcome

The proposed solution is expected to make the Incident form more user-friendly, reduce data entry errors, and improve the overall Incident Management process.
